

ARCHITECTURE and WORKFLOW

SkinSync

Your skin. Your wedding. Enhanced, not erased.

A skin-tone-aware bridal makeup companion that helps every bride describe her complexion and helps every artist honor it.

Hackathon presentation | Every tone. Every undertone.

The Problem

Bridal makeup is too often one-size-fits-all

One 'fair and lovely' style look gets applied to every bride, whatever her skin.

Bias

A lighter complexion is treated as the ideal, so deeper and warmer skin is 'corrected' instead of celebrated.

Skill and product gap

Limited training and limited shade ranges in the artist's kit mean the wrong base, wrong corrector, wrong powder.

Communication gap

Brides lack the vocabulary (depth, undertone) and artists lack a structured intake, so needs are never captured.

THE MISMATCH

The bride's real skin (Monk scale 1 to 10)

What a default 'fair' look applies to everyone

Same base, same powder, same lips. For most tones the result is a visible mismatch between face, neck and natural skin.

Ashy | Cakey | Grey-cast in photos | 'Not me'

The emotional cost

On the most important day, the bride does not recognise herself, and trust in the artist is lost.

The Solution: SkinSync

A scan, a brief and an artist match built around the bride's own complexion

What makes it different

System Architecture

Client-heavy and serverless: vision runs on the device, Supabase handles accounts and data

Bride Journey: End-to-End Workflow

From first visit to a trial with the right artist

Guests can scan and read their brief. A free account (magic-link email) is needed only to save briefs, share them with an artist, or leave a shade-accuracy review.

The Scan Pipeline

What happens in the seconds between the shutter and the brief (all on-device)

Target: under 3 seconds from capture to result. Output is a recommended range (depth +/- 1), never one exact shade.

Skin Intelligence: from Pixels to Recommendations

10 depth levels grouped into 4, crossed with 4 undertones = 16 curated rule sets

Rules are reviewed by professional makeup artists. No rule ever suggests lightening the base tone.

Data Flow: Who Talks to Whom

Analysis stays local; only derived numbers and account data reach Supabase

48-Hour Execution Plan

Who builds what, and when

Demo-ready = end-to-end flow on a real phone over HTTPS, tested on volunteers across the Monk scale.

Roadmap and Business Model

Free to build now; sustainable as it grows

Monetisation

Success metrics

SkinSync

Your skin. Your wedding. Enhanced, not erased.
